

FORMIVA WATER POLICY

As Formiva, in line with our sustainability vision, we know that water is a fundamental condition of life, the importance of water quality and quantity, and we feel responsible for its careful use. Water is used for cleaning and irrigation purposes in our fields of activity and we apply the following principles:

- We define, review and report our risks and opportunities related to water and climate within the scope of ISO 14001 and ISO 14064 and in an integrated manner with our corporate risk management processes.
- We take the necessary measures to protect water resources and prevent water pollution in all our fields of activity, monitor, report and carry out studies to further reduce our consumption.
- We store rainwater and use it as gray water in WC and green area irrigation. We carry out projects to increase resource efficiency.
- We evaluate the possibilities of transitioning to a circular economy in our activities in order to reduce the water footprint resulting from all kinds of vehicles and equipment we use throughout our life cycle, and we implement projects to realize these.

The creation and implementation of this policy, which covers all activities of our company, is ensured by the coordination of the business unit sustainability and administrative affairs departments. The review and approval of the policy is carried out by the Sustainability Department.
